

# The Sky's the Limit for Liebherr

One of the world's largest crane manufacturers, Liebherr, is benefiting from Combilift's versatility to handle a diverse range of bulky products at its manufacturing facility in Biberach in South Germany.

The massive volume of raw materials and finished product moved around the site requires a handling system that can guarantee the utmost safety and efficiency.

This was previously the job of conventional sideloaders, but their operational shortcomings, such as a lack of manoeuvrability, were limiting.

The Combilifts' 4-way capabilities are therefore ideal for handling Liebherr's products - the heaviest and largest of which measure 12.43m by 2.3m, and weigh around 12 tonnes each.

The very heavy duty 14t truck works mainly outside - its large tyres and good ground clearance being ideal for

easy operation on uneven and muddy terrain. 4t capacity C4000s are used for lighter work in the undercover storage area.

The diesel powered trucks work around the clock on a three shift basis, unloading and loading around 90 HGV's a day.

They keep the dispatch, assembly and paint shop departments constantly supplied with materials, and have proved to be extremely reliable. Southern Germany's harsh winters pose no threat of disruption, as the Combilifts have a proven track record of unhampered operation in snow and ice.

Combilift Ltd lives up to its slogan of "Customised Handling Solutions" by supplying a range of extras and attachments tailored to the operation's specific loads.

Hydraulic fork positioners and telescopic forks fitted to Liebherr's Combilifts allow easy handling of the oversized and varied dimensions that are produced at the manufacturing plant.
